

Medical and Adult ADD and Premature ejaculation

1. Depletion of the serotonin level in the brain and spine interneurons that modulate the switch of the brain's autonomous function from the parasympathetic bioelectrical recharging to the sympathetic "Fight or Flight" that is "Premature Ejaculation or Erection Withdrawal" in sexual functions. Deficiency of serotonin triggers over-conversion of dopamine/norepinephrine to adrenalin (epinephrine) for sympathetic "Fight and Flight" including mood swings, anxiety, stress, hypertension, and fatigue. It also produces ADD and ADHD.
